Minimum Wages and Employment: A Case Study of the Fast-Food Industry in New Jersey and Pennsylvania

By DAVID CARD AND ALAN B. KRUEGER*

On April 1, 1992, New Jersey's minimum wage rose from $4.25 to $5.05 per hour. To evaluate the impact of the law we surveyed 410 fast-food restaurants in New Jersey and eastern Pennsylvania before and after the rise. Comparisons of employment growth at stores in New Jersey and Pennsylvania (where the minimum wage was constant) provide simple estimates of the effect of the higher minimum wage. We also compare employment changes at stores in New Jersey that were initially paying high wages (above $5) to the changes at lower-wage stores. We find no indication that the rise in the minimum wage reduced employment. (*JEL* J30, J23)

1991年4月1日，联邦最低工资为每小时4.25美元（全国）
1990年初，新泽西州决定从1992年4月1日起将工资提高到每小时5.05美元

研究者在1992年2月、1992年11月对新泽西州、宾夕法尼亚州内的410家快餐店进行了调查，统计了包括员工数、起薪等一系列数据。

研究特点

1992年美国处于经济下行期，最低工资提高对员工数量的影响不易被经济上行掩盖。

新泽西州的经济与周边州密切相关，因此宾夕法尼亚州可以作为标准对照组。

回访覆盖率较高，数据具有可靠性。

4. Change in mean FTE employment, balanced sample of stores[c]	−2.28 (1.25)	0.47 (0.48)	2.75 (1.34)	1.21 (0.82)	0.71 (0.69)	−2.16 (1.01)	3.36 (1.30)	2.87 (1.22)
5. Change in mean FTE employment, setting FTE at temporarily closed stores to 0[d]	−2.28 (1.25)	0.23 (0.49)	2.51 (1.35)	0.90 (0.87)	0.49 (0.69)	−2.39 (1.02)	3.29 (1.34)	2.88 (1.23)

Notes: Standard errors are shown in parentheses. The sample consists of all stores with available data on employment. FTE (full-time-equivalent) employment counts each part-time worker as half a full-time worker. Employment at six closed stores is set to zero. Employment at four temporarily closed stores is treated as missing.

[a]Stores in New Jersey were classified by whether starting wage in wave 1 equals $4.25 per hour ($N = 101$), is between $4.26 and $4.99 per hour ($N = 140$), or is $5.00 per hour or higher ($N = 73$).

[b]Difference in employment between low-wage ($4.25 per hour) and high-wage (≥ $5.00 per hour) stores; and difference in employment between midrange ($4.26–$4.99 per hour) and high-wage stores.

[c]Subset of stores with available employment data in wave 1 and wave 2.

[d]In this row only, wave-2 employment at four temporarily closed stores is set to 0. Employment changes are based on the subset of stores with available employment data in wave 1 and wave 2.

Notes: Standard errors are given in parentheses. The sample consists of 357 stores with available data on employment and starting wages in waves 1 and 2. The dependent variable in all models is change in FTE employment. The mean and standard deviation of the dependent variable are −0.237 and 8.825, respectively. All models include an unrestricted constant (not reported).

[a]Proportional increase in starting wage necessary to raise starting wage to new minimum rate. For stores in Pennsylvania the wage gap is 0.

[b]Three dummy variables for chain type and whether or not the store is company-owned are included.

[c]Dummy variables for two regions of New Jersey and two regions of eastern Pennsylvania are included.

[d]Probability value of joint F test for exclusion of all control variables.

Notes: Entries in columns (i) and (ii) represent mean changes in the outcome variable indicated by the row heading for stores with available data on the outcome in waves 1 and 2. Entries in columns (iv)–(vi) represent estimated regression coefficients of indicated variable (NJ dummy or initial wage gap) in models for the change in the outcome variable. Regression models include chain dummies and an indicator for company-owned stores.

[a]The wage gap is the proportional increase in starting wage necessary to raise the wage to the new minimum rate. For stores in Pennsylvania, the wage gap is zero.

[b]Models in column (vi) include dummies for two regions of New Jersey and two regions of eastern Pennsylvania.

[c]Fraction of part-time employees in total full-time-equivalent employment.

5. Standard error of regression	0.101	0.097	0.102	0.098	0.097

Notes: Standard errors are given in parentheses. Entries are estimated regression coefficients for models fit to the change in the log price of a full meal (entrée, medium soda, small fries). The sample contains 315 stores with valid data on prices, wages, and employment for waves 1 and 2. The mean and standard deviation of the dependent variable are 0.0173 and 0.1017, respectively.

[a]Proportional increase in starting wage necessary to raise the wage to the new minimum-wage rate. For stores in Pennsylvania the wage gap is 0.

[b]Three dummy variables for chain type and whether or not the store is company-owned are included.

[c]Dummy variables for two regions of New Jersey and two regions of eastern Pennsylvania are included.

TURNING POINT ANALYSIS FOR MODEL (III)

Turning point of quadratic function: 0.1291 Benchmark comparison value [(5.05-4.25)/4.25]: 0.1882

Gap coefficient: 52.6869 Gap squared coefficient: -204.024766

Interpretation:

- The quadratic relationship peaks/troughs at a wage gap of 0.1291
- This turning point (0.1291) is LOWER than the benchmark (0.1882)
- Difference: 0.0591

复现流程

1. 通读论文，了解论文的目的、结论和用到的工具
2. 查看论文中提到的数据的具体定义和计算方式
3. 查看数据集的格式和码本
4. 以此来编写程序提取分析数据集
5. 如果复现的数据和原始数据不同，分析可能的原因并尝试做出修正

- 使用 pandas 来读取数据
- 使用 scipy 库来做矩阵运算，做 t 检验等
- 使用 statsmodels 提供公式化接口，与 pandas 集成等

难点

缺失值的处理

- 在分析数据的时候，使用了多种缺失值处理方法
- 比如在平衡子样本中，把第二次采访中不营业的店铺视为缺失值，然后不参与计算。之后又把关门的店铺的员工数视为 0，暂停营业的店铺视为缺失值。在最后又把暂停营业的店铺的员工数视为 0

标准差的计算

- 部分表格数据的标准差不知道是怎么计算出来的
- 比如 Table 3 中第三行的标准差，我们使用第一行和第二行的方差之和当作第三行的方差。当然，第三行的标准差并不重要，重要的只是元素值

计算精度的差异

- 不少我们复现得出的数据的最后一位数字与原始表格差 1，这大概率是计算精度导致的
- 少部分数据的最后一位数字的差距大于 1，但是又没有很大的差异，我们检查了计算逻辑，并没有发现问题，不清楚为什么会导致数据不匹配

Notes: Standard errors are shown in parentheses. The sample consists of all stores with available data on employment. FTE (full-time-equivalent) employment counts each part-time worker as half a full-time worker. Employment at six closed stores is set to zero. Employment at four temporarily closed stores is treated as missing.

[a] Stores in New Jersey were classified by whether starting wage in wave 1 equals $4.25 per hour ($N = 101$), is between $4.26 and $4.99 per hour ($N = 140$), or is $5.00 per hour or higher ($N = 73$).

[b] Difference in employment between low-wage ($4.25 per hour) and high-wage (≥ $5.00 per hour) stores; and difference in employment between midrange ($4.26–$4.99 per hour) and high-wage stores.

[c] Subset of stores with available employment data in wave 1 and wave 2.

[d] In this row only, wave-2 employment at four temporarily closed stores is set to 0. Employment changes are based on the subset of stores with available employment data in wave 1 and wave 2.

or

(1b) $$\Delta E_i = a' + \mathbf{b}'\mathbf{X}_i + c'\mathrm{GAP}_i + \varepsilon_i'$$

where ΔE_i is the change in employment from wave 1 to wave 2 at store i, $\mathbf{X}_i$ is a set of characteristics of store i, and NJ_i is a dummy variable that equals 1 for stores in New Jersey. GAP_i is an alternative measure of the impact of the minimum wage at store i based on the initial wage at that store (W_{1i}):

$\mathrm{GAP}_i = 0$ for stores in Pennsylvania

$= 0$ for stores in New Jersey with $W_{1i} \geq \$5.05$

$= (5.05 - W_{1i}) / W_{1i}$ for other stores in New Jersey.

Notes: Standard errors are given in parentheses. The sample consists of 357 stores with available data on employment and starting wages in waves 1 and 2. The dependent variable in all models is change in FTE employment. The mean and standard deviation of the dependent variable are −0.237 and 8.825, respectively. All models include an unrestricted constant (not reported).

[a]Proportional increase in starting wage necessary to raise starting wage to new minimum rate. For stores in Pennsylvania the wage gap is 0.

[b]Three dummy variables for chain type and whether or not the store is company-owned are included.

[c]Dummy variables for two regions of New Jersey and two regions of eastern Pennsylvania are included.

[d]Probability value of joint F test for exclusion of all control variables.

Notes: Entries in columns (i) and (ii) represent mean changes in the outcome variable indicated by the row heading for stores with available data on the outcome in waves 1 and 2. Entries in columns (iv)–(vi) represent estimated regression coefficients of indicated variable (NJ dummy or initial wage gap) in models for the change in the outcome variable. Regression models include chain dummies and an indicator for company-owned stores.

[a]The wage gap is the proportional increase in starting wage necessary to raise the wage to the new minimum rate. For stores in Pennsylvania, the wage gap is zero.

[b]Models in column (vi) include dummies for two regions of New Jersey and two regions of eastern Pennsylvania.

[c]Fraction of part-time employees in total full-time-equivalent employment.

4. Controls for region[c]	no	no	no	no	yes
5. Standard error of regression	0.101	0.097	0.102	0.098	0.097

Notes: Standard errors are given in parentheses. Entries are estimated regression coefficients for models fit to the change in the log price of a full meal (entrée, medium soda, small fries). The sample contains 315 stores with valid data on prices, wages, and employment for waves 1 and 2. The mean and standard deviation of the dependent variable are 0.0173 and 0.1017, respectively.

[a]Proportional increase in starting wage necessary to raise the wage to the new minimum-wage rate. For stores in Pennsylvania the wage gap is 0.

[b]Three dummy variables for chain type and whether or not the store is company-owned are included.

[c]Dummy variables for two regions of New Jersey and two regions of eastern Pennsylvania are included.
